Information Overload

Problems...

- Explosion of irrelevant, unclear, inaccurate information
- **Users overloaded** with a large amount of information impossible to absorb

...and consequences

- Searching is time consuming
- Need for **intelligent solutions** able to support users in finding documents according to their interests

How Much Information?

- ① Print, film, magnetic and optical storage media produced between 3.4 and 5.4 exabytes of unique information in 2002
 - ✓ 92% stored on magnetic media, mostly hard disks
 - ✓ 500-800 MB per person each year
- ② Information flow through electronic channels - telephone, radio, TV, and the Internet - contained almost 18 exabytes of new information in 2002 (3 ½ more than recorded in storage media), 281 exabytes in 2007 (45 GB per person)

Medium	Terabytes
Radio	3,488
Television	68,955
Telephone	17,300,000
Internet	532,897
TOTAL	17,905,340

Medium	Terabytes
Surface Web	167
Hidden Web	91,850
E-mail	440,606
Inst. Messaging	274
TOTAL	532,897

How to defend oneself from Information Overloading

Se si vuole trovare una metafora del rapporto fra l'uomo e i mezzi di comunicazione, Umberto Eco suggerisce quella dell'automobilista:

la tecnologia ha messo a disposizione vetture sempre più sofisticate, potenti e veloci; che vengano usate per portare una persona all'ospedale o per fare le gare di velocità sulle strade, dipende da chi è seduto al posto di guida.

Lo stesso si può dire di quella che ormai è diventata una delle relazioni fondamentali della nostra vita quotidiana, cioè il nostro modo di interagire con i mass media, dalla televisione al telefonino, da Internet alla radio, dai libri ai cd e dvd (ebbene sì, anch'essi sono media), alla posta elettronica: dipende dalla cultura e dalla volontà di ciascuno di noi, educato soprattutto dalla scuola e dalla famiglia, mettere a punto una “dieta mediatica”

– suggerisce Gianfranco Bettetini – che non provochi né obesità né anoressia.

da: “Mettete a dieta i mass-media”

Popular Information Seeking strategies

Information Retrieval [Baeza-Yates and Ribeiro-Neto 1999]

- “Information Retrieval (IR) deals with the representation, storage, organization of, and access to information items”
- “...the user must first translate this information need into a *query* which can be processed by a search engine (or IR system)”.
- “Given the user query, the key goal of an IR system is to retrieve information which might be useful or relevant to the user. The emphasis is on the retrieval of *information* as opposed to the retrieval of *data*”.

Information Filtering [Hanani et al. 2001]

- “The aim of Information Filtering (IF) is to expose users to only the information that is relevant to them. Some examples of filtering applications are: filters for search results on the internet,... e-mail filters based on *personal profiles*, ... filters for e-commerce applications that address products and promotions to potential customers only...”

Comparing IR and IF

Parameters	Information Retrieval	Information Filtering
representation of Information Needs	Queries	User Profiles
Goal	selection of items relevant for query	filtering out irrelevant items or collecting items
Frequency of use	ad hoc use one time users	repetitive use long term users
Type of Users	Not known to the system	“Profiled”
Database	(relatively) static	very large dynamic

Table adapted from [Hanani et al. 2001]

Comparing IR and IF

Common Mechanisms

- **Representation:** Both the user's information need – query or profile – and the document set must be represented for *comparison*
- **Comparison:** String matching? Concept matching?
- **Feedback:** To improve the performance of the IR/IF system, a feedback mechanism is usually incorporated.

Some Problems in IR systems... Polysemy

Vertebrate Flight

CHIROPTERAN FLIGHT

The Chiroptera, or bats, are the second most diverse group of mammals, and are the only mammals ever to evolve true powered flight. The evolutionary origin of chiropterans is still somewhat of a mystery, because the fossil record of bats is scant. Some cladistic analyses indicate that bats are most closely related to the dermopterans, such as *Cynoccephalus*, the colugo or "flying lemur" (which does not fly and is not a lemur). But others suggest that they are not so closely related. However, their ancestors may have been similar in some

Bat

From Wikipedia, the free encyclopedia

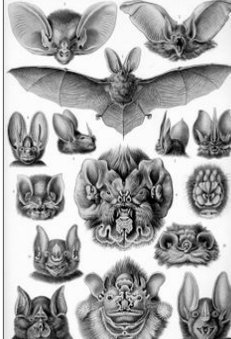

For other uses, see *Bat (disambiguation)*.
 "Chiroptera" redirects here. For other uses, see *Chiroptera (disambiguation)*.

A **bat** is a **mammal** in the **order Chiroptera**. Their most distinguishing feature is that their forelimbs are developed as **wings**, making them the only **mammals** in the world naturally capable of **flight** (though other mammals, such as **flying squirrels** and gliding **fruit-eating possums**, can **glide** for limited distances). The word *Chiroptera* can be translated from Greek words for "hand wing," as the structure of the open wing is very similar to a human hand with a **membrane** (**patagium**) between the fingers that also stretches between hand and body.

There are estimated to be about 1,000 species of bats worldwide, accounting for about 20% of all mammal species.^[1] About 10% of bats are **insectivores**. Of the remainder, most feed on **fruits** and their juices; three species sustain themselves with **blood** and some prey on **vertebrates**. These bats include the **leaf-nosed bats** (Phyllostomidae) of **Central America** and **South America**, and the related **bulldog bats** (Noctilionidae) that feed on **fish**. At least two known species of bat feed on other bats: the **Spectral Bat**, also called the American False Vampire bat, and the **Ghost Bat** of **Australia**. One species, the **Greater Noctule bat**, is believed to catch and eat small **birds** in the air. Despite the cold weather, there are 6 species of bats in **Alaska**.

Some of the smaller bat species are important **pollinators** of some tropical **flowers**. Indeed, many tropical plants are now found to be totally dependent on them, not just for **pollination**, but for spreading their **seeds** by eating the resulting fruits. This role explains environmental concerns when a bat is **introduced** in a new setting. *Tenaglia* provides a recent example with the introduction

Bats
 Fossil range: Late **Paleocene** - Recent

Some Problems in IF systems...

- ① IF systems perform the filtering task on the basis of **user profiles**
 - ✓ Structured model of the **user interests**
 - ✓ User profiles compared against item descriptions to provide recommendations
- ② Problems: keywords not appropriate for representing content, due to **polysemy**, **synonymy**, **multi-word concepts** (*homography*, *homophony*) – “Sator arepo eccetera” (Eco, 2007)

Some Problems in IF systems... (cont'd)

POLYSEMY

Tackling IR/IF problems

Putting **Intelligence** into Search/Filtering Tasks =

1. **Semantics**: concept identification in documents through advanced NLP techniques → “*beyond keywords*”

+

1. **Personalization**: representation of the user information needs in an effective way → “(high-accuracy) *user profiles*”

Information Seeking Support Systems (ISSSs):

tools that aid people in managing, analyzing, and sharing sets of retrieved information.

ISSSs provide search solutions that empower users to go beyond single-session lookup tasks.

G. Marchionini and R.W. White. Information-Seeking Support Systems. *IEEE Computer* 42(3):30-32, March 2009.

Meno's Paradox: Search is not so simple as it might seem

Meno: And how will you enquire, Socrates, into that which you do not know? **What will you put forth as the subject of enquiry?** And if you find what you want, **how will you ever know that this is the thing which you did not know?**

Socrates: I know, Meno, what you mean; but just see what a tiresome dispute you are introducing. You argue that man cannot enquire either about that which he knows, or about that which he does not know; for if he knows, he has no need to enquire; and if not, he cannot; for he does not know the very subject about which he is to enquire.

Plato Meno 80d-81a

<http://www.gutenberg.org/etext/1643>

Meno's question in our time

with modern ISSSs:

“How to discover the *magic words* that will connect you to the information you seek?”

The focus of many studies has been to point out methods for text processing to enable a system to **make connections between the terminology of the user request (implicit/explicit) and related terminology in the information needed**

Need for semantics for text interpretation

Beyond (Keyword) Search: Semantics by way of Knowledge Infusion

- ① Humans typically have the *linguistic* and *cultural* experience to comprehend the meaning of a text
 - ✓ How to realize this *capability* into machines?
- ② In NLP tasks, computers require access to vast amounts of common-sense and domain-specific world knowledge
 - ✓ Infusing lexical knowledge → Dictionaries (e.g. WordNet)
 - ✓ Infusing cultural knowledge → Wikipedia

Collaborative / Social Filtering

- ① *Word of Mouth / “Wisdom of the Masses”*
- ② Makes use of a database of user preferences in order to:
 - ✓ find users with *similar* interests
 - ✓ predict whether an *unseen* information item is likely to be of interest for a user based on how *other* users rated that item
- ③ Widely adopted in recommender systems [Resnick and Varian 1997, Linden et al. 2003]

Recommender Systems have the effect of guiding the user in a personalized way to interesting or useful objects in a large space of possible options [Burke, 2002]

[Burke 2002] R. Burke. Hybrid Recommender Systems: Survey and Experiments. *User Modeling and User-Adapted Interaction* 12(4):331-370, 2002.

[Resnick and Varian 1997] Resnick, P. and H. Varian. Recommender Systems. *Communications of the ACM* 40(3):56-58, 1997.

[Linden et al. 2003] Linden, G., B. Smith, and J. York. Amazon.com Recommendations: Item-to-Item Collaborative Filtering. *IEEE Internet Computing* 7(1), 76-80, 2003.

Collaborative / Social Filtering

- ① *Word of Mouth / “Wisdom of the Masses”*
- ② Makes use of a database of user preferences in order to:
 - ✓ find users with *similar* interests
 - ✓ predict whether an *unseen* information item is likely to be of interest for a user based on how *other* users rated that item
- ③ Widely adopted in recommender systems [Resnick and Varian 1997, Linden et al. 2003]

Recommender Systems provide personalized suggestions about items that the user might find interesting, by matching items to user profiles or groups [Kangas, 2001]

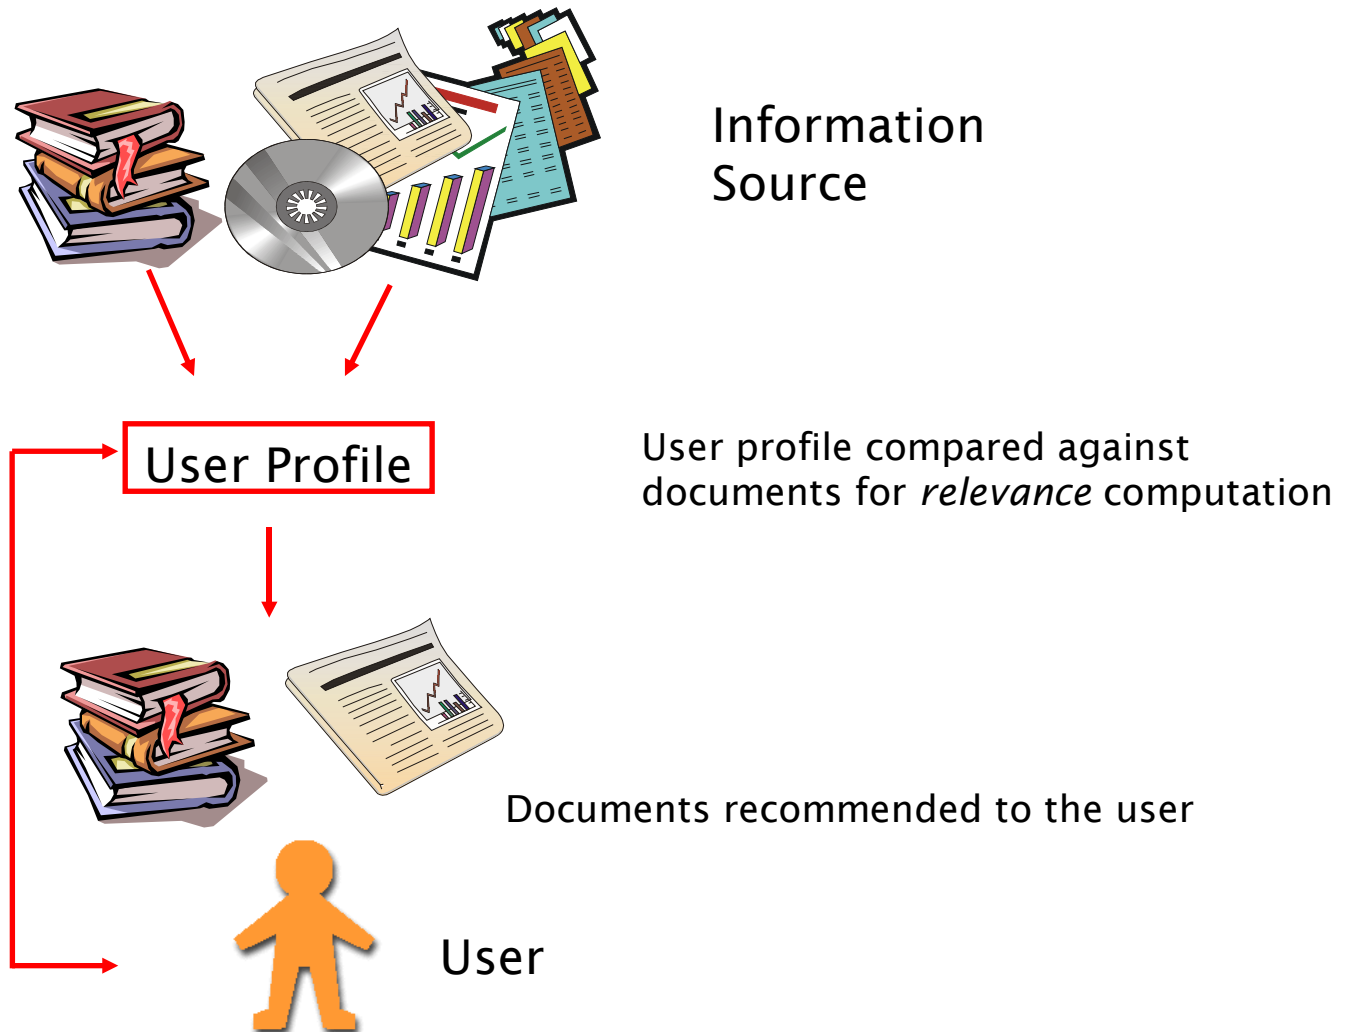

Collaborative / Social Filtering

- ① *Word of Mouth / “Wisdom of the Masses”*
- ② Makes use of a database of user preferences in order to:
 - ✓ find users with *similar* interests
 - ✓ predict whether an *unseen* information item is likely to be of interest for a user based on how *other* users rated that item
- ③ Widely adopted in recommender systems [Resnick and Varian 1997, Linden et al. 2003]

Recommendation process

Given a large set of items and a description of the user's needs, the goal is to present a small set of the items that are suited to the user needs

Content-based Filtering

Content-based Filtering

- ① Each user is assumed to operate independently
- ② Items are represented by some features
 - ✓ Movies: actors, directors, plot, ...
- ③ Machine Learning for automated inference of user profile from user's behavior
 - ✓ Relevance judgment on items, e.g. ratings
 - ✓ Training on rated items → user profile
- ④ Filtering based on the comparison between the *content* of the items and the user preferences as defined in the user profile
 - ✓ Keyword-based representation for content and profiles → string matching

27) Caravaggio - Deposition from the Cross

Descrizione dell'opera

The Deposition, considered one of Caravaggio's greatest masterpieces, was commissioned by Girolamo Vittrice for his family chapel in S. Maria in Vallicella (Chiesa Nuova) in Rome. In 1797 it was included in the group of works transferred to Paris in execution of the Treaty of Tolentino. After its return in 1817 it became part of Pius VII's Pinacoteca. Caravaggio did not really portray the Burial or the Deposition in the traditional way, inasmuch as Christ is not shown at the moment when he is laid in the tomb, but rather when, in the presence of the holy women, he is laid by Nicodemus and John on the Anointing Stone, that is the stone with which the sepulchre will be closed. Around the body of Christ are the Virgin, Mary Magdalene, John, Nicodemus and Mary of Cleophas, who raises her arms and eyes to heaven in a gesture of high dramatic tension. Caravaggio, who arrived in Rome towards 1592-93, was the protagonist of a real artistic revolution as regards the way of treating subjects and the use of colour and light, and was certainly the most important personage of the "realist" trend of seventeenth century painting.

27) Caravaggio - Deposition from the Cross

Descrizione dell'opera

The Deposition, considered one of Caravaggio's masterpieces, was painted in the chapel in S. Maria in Vallicella (Chiesa Nuova) in Rome. In 1797 it was included in the group of works transferred to Paris in execution of the Treaty of Tolentino. After its return in 1817 it became part of Pius VII's Pinacoteca. Caravaggio did not really portray the Burial or the Deposition in the traditional way, inasmuch as Christ is not shown at the moment when he is laid in the tomb, but rather when, in the presence of the holy women, he is laid by Nicodemus and John on the Anointing Stone, that is the stone with which the sepulchre will be closed. Around the body of Christ are the Virgin, Mary Magdalene, John, Nicodemus and Mary of Cleophas, who raises her arms and eyes to heaven in a gesture of high dramatic tension. Caravaggio, who arrived in Rome towards 1592-93, was the protagonist of a real artistic revolution as regards the way of treating subjects and the use of colour and light, and was certainly the most important personage of the "realist" trend of seventeenth century painting.

M. de Gemmis, P. Lops, G. Semeraro, and P. Basile. Integrating Tags in a Semantic Content-based Recommender. In *RecSys '08 - Proceed. of the 2nd ACM Conference on Recommender Systems, October 23-25, 2008, Lausanne, Switzerland*, pages 163-170. Association for Computing Machinery, ACM, 2008.

Outline

① INTRODUCTION

- ✓ The Information Overloading Problem
- ✓ Personalization on the Web

② INFORMATION SEEKING STRATEGIES

③ INFORMATION FILTERING

- ✓ Collaborative Filtering
- ✓ Content-based Filtering & User Profiling

④ IDEAS FOR INTELLIGENT INFORMATION FILTERING

⑤ CONCLUDING REMARKS

⑥ LIVE DEMO

Concluding Remarks and Future Work

- ① Need for *intelligent* solutions and tools for Information Access in the information overload era
- ② New strategies for Information Filtering & Retrieval
 - ✓ Semantics: to capture the meaning of content and user needs
 - ✓ Personalization & User Profiling for adapting results to user information needs

Future Work

- ✓ Serendipity within Recommender System (avoiding the *homophily* trap [Zuckerman 2008])
- ✓ How to make serendipity operational? An initial attempt in [laquinta et al. 2008]

E. Zuckerman. [Homophily, serendipity](http://www.ethanzuckerman.com/blog/2008/04/25/homophily-serendipity-xenophilia/), xenophilia. April 25, 2008.

Live Demo

Sensemaking

- ① Many information search tasks are part of a broader class of tasks called *sensemaking*
- ② *Sensemaking* involves finding and collecting information from large collections, organizing and understanding that information and producing some product
 - ✓ understanding a health problem to make a medical decision
 - ✓ deciding which laptop to buy

Sensemaking

- ① Searching and filtering are the basic steps of the *sensemaking* overall process
- ② Reading and extracting information from retrieved documents are essential steps for decision making and other complex mental activities
 - ✓ Retrieval/Filtering are necessary but not sufficient

Examples of challenging sensemaking processes

① Just for fun:

OTTHO (On the Tip of my THOught) [Semeraro et al. 2009]

- ✓ La Ghigliottina: very popular linguistic game
- ✓ Umberto Eco's article "La nostra ghigliottina quotidiana" on "L'Espresso"

② More serious: Discovering "hidden" correlations among documents

U. Eco. La nostra ghigliottina quotidiana. April 24, 2008.
